## QUESTIONS

**INSTRUCTIONS:** Follow the 'GO TO' letter or number on the right for each answer. Only answer the questions to which you are directed. When you are directed to a letter, this is the final recommendation (shown over the page).

### START HERE

<b>1</b>	<b>Are these does that will kid within 4 weeks?</b>	<b>GO TO</b>
	<ul style="list-style-type: none"> <li>• Yes, and the kidding paddock is low worm-risk (see definition<sup>1</sup> at bottom of page)</li> </ul>	<b>A</b>
	<ul style="list-style-type: none"> <li>• Yes, but the kidding paddock is NOT low worm-risk (see definition<sup>1</sup> at bottom of page)</li> </ul>	<b>B</b>
	<ul style="list-style-type: none"> <li>• No</li> </ul>	<b>2</b>
<b>2</b>	<b>Are these kids that will be weaned within 2 weeks?</b>	
	<ul style="list-style-type: none"> <li>• Yes, and the weaning paddock is low worm-risk (see definition<sup>1</sup> at bottom of page)</li> </ul>	<b>C</b>
	<ul style="list-style-type: none"> <li>• Yes, but the weaning paddock is NOT low worm-risk (see definition<sup>1</sup> at bottom of page)</li> </ul>	<b>D</b>
	<ul style="list-style-type: none"> <li>• No</li> </ul>	<b>3</b>
<b>3</b>	<b>On close inspection (with goats yarded or held tightly against a fence), are these goats showing signs<sup>4</sup> suggesting a worm infection?</b>	
	<ul style="list-style-type: none"> <li>• There are no signs of worm infection</li> </ul>	<b>4</b>
	<ul style="list-style-type: none"> <li>• There are no signs of worm infection AND I have a recent worm egg count</li> </ul>	<b>4</b>
	<ul style="list-style-type: none"> <li>• Yes, at least 2% of the mob are showing signs: including pale inside eyelids and gums, bottle jaw, lagging/collapse</li> </ul>	<b>E</b>
	<ul style="list-style-type: none"> <li>• Yes, only 1–2% of the mob are showing signs: including pale inside eyelids and gums, bottle jaw, lagging/collapse</li> </ul>	<b>F</b>
	<ul style="list-style-type: none"> <li>• Yes, some are scouring, but not showing the other signs listed above</li> </ul>	<b>G</b>
<b>4</b>	<b>What 'length of protection' treatment type was last used?</b>	
	<ul style="list-style-type: none"> <li>• Persistent (mid-length and long-acting drenches, injections and capsules giving ongoing protection)</li> </ul>	<b>H</b>
	<ul style="list-style-type: none"> <li>• Short-acting (drenches with no ongoing protection) or the last treatment type is unknown</li> </ul>	<b>5</b>
<b>5</b>	<b>What type of WormTest results do you have?</b>	
	<ul style="list-style-type: none"> <li>• Worm egg counts and a culture</li> </ul>	<b>6</b>
	<ul style="list-style-type: none"> <li>• Worm egg counts but no culture (consider a culture next time), however recent culture or experience suggests barber's pole worm</li> </ul>	<b>7</b>
	<ul style="list-style-type: none"> <li>• Worm egg counts but no culture (consider a culture next time), however recent culture or experience suggests scour worms</li> </ul>	<b>8</b>
	<ul style="list-style-type: none"> <li>• None</li> </ul>	<b>I</b>
	<p><i>NOTE: If treatment was less than 3 weeks ago and you now have a positive result, your drench may be ineffective. Seek veterinary advice because a DrenchTest might be required.</i></p>	

<b>6</b>	<b>Is the percentage of barber's pole worm (<i>Haemonchus contortus</i>), shown in the larval culture, higher than 60%?</b>	<b>GO TO</b>																																								
	<ul style="list-style-type: none"> <li>• Yes</li> </ul>	<b>7</b>																																								
	<ul style="list-style-type: none"> <li>• No</li> </ul>	<b>8</b>																																								
<b>7</b>	<b>There are greater than 60% barber's pole worms.</b> In the table below, find the worm egg count threshold for the average goat condition of your mob and the condition of the pasture they will graze. (If pasture <sup>2</sup> or goat condition <sup>3</sup> is unknown, use a worm egg count value of 400 epg [southern] or 800 epg [northern]).  Worm egg count (epg) thresholds for <b>barber's pole worm</b>

## Definitions

<sup>1</sup> Preparing low worm-risk paddocks involves preventing worm contamination on them prior to use; 3 months for a summer weaning paddock, and just the warmer months (daily max. temperature >18°C) in the 6 months prior for a spring kidding.

<sup>2</sup> Pasture condition can also be defined by the amount of green herbage mass in kg DM/ha  
 • Poor: less than 600 kg DM of green herbage mass/ha  
 • Moderate: 600–1200 kg DM of green herbage mass/ha  
 • Good: more than 1200 kg DM of green herbage mass/ha

<sup>3</sup> Goat condition can also be defined by body condition scores  
 • Poor: score 2 or less  
 • Moderate: score 2.5  
 • Good: score 3 or better

## GOATS

### RECOMMENDATIONS

**INSTRUCTIONS:** Read the **recommendation** that you have been directed to from the Drench Decision Guide questions, plus the information in the other three green boxes below.

- A** Treat kidding does with an effective short-acting drench<sup>6</sup> and then *WormTest* 1 week before marking. In a well-prepared low worm-risk paddock, does often do not need treatment at marking.  
See NOTE below.
- B** Treat kidding does with an effective short-acting drench<sup>6</sup>. A *WormTest* 1 week before marking is essential.  
Consider preparing a low worm-risk kidding paddock from autumn next year.  
See NOTE below.
- C** Treat weaners with an effective short-acting drench<sup>6</sup> and then *WormTest* 4 weeks later<sup>5</sup>.  
See NOTE below.

NOTE: While mid-length (some combined with vaccine) and long-acting 'mectin'/ML (macrocytic lactone) products provide convenience, their use in this situation can increase drench resistance on your farm. It is best to reserve these treatments for the higher and longer worm-risk times later in summer and autumn. They are not required when low worm-risk paddocks are used.

#### <sup>4</sup>Signs of worms

Closely examine for signs of worms, yard or hold goats against a fence. Catch and examine 5–10 animals.

**Barber's pole worm:** anaemia (pale inside eyelids and gums); 'bottle jaw' (swelling under the jaw); lagging or collapse when mustered; death.

**Scour worms** (black scour worm [*Trichostrongylus* species]; brown stomach worm [*Teladorsagia circumcincta*]; and others [incl. *Nematodirus*]): dark scours; weight loss; death.

NOTE: Other diseases and poor nutrition can cause similar signs. Consider seeking veterinary advice.

- D** Treat weaners with an effective short-acting drench<sup>6</sup> and then *WormTest* 4 weeks later<sup>5</sup>. However, a long-acting treatment may be warranted at weaning because low worm-risk weaning paddocks were not prepared and if the next few months are predicted to be high worm-risk weather conditions. Follow the guidelines below for long-acting drenches<sup>6</sup>.
- E** Treat the entire mob now with a drench<sup>6</sup> shown to be effective against the worms present and then *WormTest* 4 weeks later<sup>5</sup>.  
NOTE: Do not use an organophosphate drench on severely worm-affected or stressed goats. Consider that other parasites/diseases cause similar signs.
- If the paddock to be used after treatment is not considered to be highly contaminated with worm larvae, give an effective short-acting drench<sup>6</sup> and *WormTest* in 4 weeks<sup>5</sup>.
  - If the paddock to be used after treatment is considered to be highly contaminated with worm larvae, give an effective long-acting treatment. Follow the guidelines below for long-acting drenches<sup>6</sup>. Usually, long-acting 'mectin'/ML (macrocytic lactone) treatments are best restricted to February–April to minimize development of ML resistance, but high worm-risk may require its use at other times.

#### <sup>5</sup>High risk barber's pole worm conditions

Goats can sometimes be rapidly re-infected with worms, causing illness and death within 2 weeks of a drench. In these situations (i) check at least weekly for visual signs of barber's pole worm; and (ii) conduct a *DrenchCheck*. To reduce this risk, prepare low worm-risk pastures.

**F** Treat affected individuals now with an effective short-acting drench<sup>6</sup> and *WormTest* the mob now. Also, investigate other causes of their signs.

NOTE: Do not use an organophosphate drench on severely worm-affected or stressed goats.

**G** *WormTest* and proceed from Question 6 of the *Drench Decision Guide* questions.

- If the test shows that scour worms do not require treatment, then the scouring may be from coccidiosis or feed and you should seek veterinary advice on treatment or management.
- If treatment is required, use an effective short-acting drench<sup>6</sup>.

**H**

- If *WormTest* results are greater than 100 epg, treat with an effective short-acting drench<sup>6</sup> and then *WormTest* 4–6 weeks later<sup>5</sup>.
- If you have no *WormTest* results (or worm egg counts are below 100 epg), follow the instructions below to check effectiveness of your treatment at day 60. Also follow the guidelines below for long-acting drenches<sup>6</sup>.

Anytime that you are concerned that the treatment is not providing protection, *WormTest* immediately.

**I** *WormTest* in 4 weeks (summer) or 6 weeks (winter) after the last treatment was given and observe goats closely for signs of worms<sup>5</sup>.

**J** *WormTest* in another 4 weeks (summer) or 6 weeks (winter) and observe goats closely for signs of worms<sup>5</sup>.

#### <sup>6</sup>Guidelines for worm control treatments

**When using anthelmintic products in goats, obtain a veterinary prescription because:**

- Goats require a different dose rate and withholding period to that on the label.
- Many drenches are not registered for use in goats (see exceptions below).

**Victoria:** over the counter drenches can be used if residues are kept below the Maximum Residue Limits (MRL).

**South Australia:** cattle drenches can be used in goats, but pour-on formulations should be avoided.

##### When giving all treatments

Follow the product labels or veterinarian's instructions. Dose to the heaviest goat in the group. Calibrate equipment to ensure the right dose is delivered with the right procedures. Do not mix drenches unless the label states they are compatible. Check and comply with withholding periods and export slaughter intervals.

##### Choosing treatment options on your property

Use these principles together, where possible:

- Use drenches tested to be most effective on your property and either multi-active products or more than one active concurrently (up the race with one and then the other); if drench effectiveness is unknown,

conduct a *DrenchCheck* after drenching.

- Use short-acting treatments—reserve long-acting products for specific purposes or high worm-risk times.

For more details read the drench resistance section in the WormBoss Worm Control Program.

##### Check effectiveness of long-acting treatments

Use only under veterinary prescription.

*WormTest* with a culture at 35, 60 and 90 days after treatment.

If *WormTest* results are 100 epg or above, drench resistance is likely. Drench immediately with an effective short-acting drench with a different drench group to the long-acting treatment. Seek veterinary advice on the further use of this product. If *WormTest* results are less than 100 epg, then treat with an exit drench at 100 days after the long-acting treatment was given.

Seek veterinary advice if *WormTests* are positive at or before 60 days.

##### Primer and exit drenches

These help to slow drench resistance to persistent treatments.

##### Protection period of persistent treatments

(These are for sheep as goat times are unknown, but likely

much shorter as goats metabolise the drenches faster)

Mid-length: 7–28 days. Long-acting: 91–100 days.

NOTE: The protection period against susceptible black scour worm with a long-acting moxidectin injection is 49 days in sheep, but is not set in goats.

##### Use a primer before long-acting treatments

Primer drenches (effective short-acting treatments that do not include the drench group in the long-acting treatment) should be given concurrently with all long-acting treatments.

##### Use an exit drench after all mid-length and long-acting treatments

- Treat with an 'exit drench'—an effective short-acting treatment that does not include the drench group in the mid-length or long-acting treatment. Also called a 'tail-cutter' drench.
- Give this at 42 days (mid-length) or 100 days (long-acting) after the treatment was given.
- WormTest* 4–6 weeks after the exit drench.

Anytime that you are concerned that the persistent treatment is not providing protection, *WormTest* immediately and seek veterinary advice regarding drench resistance.
